

Golden Book For Medicine OSPE

By MAN B PAUDYAL
- MBBS(IOM)

1. A 14-year-old girl presents to the emergency room with acute abdominal pain and constipation. An ultrasound reveals a "target sign", suggesting intussusception. A CT scan confirms this diagnosis. On closer examination, her palms and oral mucosa are spotted with multiple 1-2 mm blue-gray macule. What is probable Diagnosis?

Diagnosis: Peutz-Jeghers Syndrome

Diagnosis requires: 2/3

- small bowel polyposis
- Mucocutaneous Pigmentation
- Family history suggesting autosomal dominant inheritance.

ACROMEGALY SERIES

This picture shows protuberance of the frontal
skeletal bones and brow ridge (frontal bossing).

This picture shows facial features typical of acromegaly including enlarged head, enlarged jaw, and frontal bossing.

This picture shows increased teeth spacing, characteristic of acromegaly.

This picture shows a normal hand on the left and an enlarged hand on the right (acromegaly)

2. Carefully examine the given photograph and answer the following Questions.

1. What is the neurological Abnormality?
2. Name the two signs which are shown?
3. Commonest cause of this condition
4. If she had a vesicular rash on her ear, what will u call it?

Answer:

- left lower motor neuron palsy of Viiith nerve
- Deviation of angle of mouth to normal(right), flattened nasolabial fold, prominent palpebral fissure
- Idiopathic called Bell's palsy possibly due to Herpes Simplex Infection.
- Ramsay Hunt Syndrome.

3. Carefully observe and answer following questions

- Name the sign?
- Name three others signs that may be present in this patient?
- Commonest Cause?

Answer:

- spider Angioma
- Three sign of cirrhosis: Ascites, Splenomegaly, Gynecomastia
- Cirrhosis of liver

3. Examine and answer following question?

- A. Describe abnormality?
- B. Most likely Diagnosis?
- C. Name diagnostic test?
- D. Four treatment option?

Answer:

- B/L ptosis And lack of facial expression
- Myasthenia Gravis
- Edrophonium test
- Pyridostigmine, Corticosteroids, Immunosuppressive, thymectomy

4. A 50 years old male presented with chronic productive cough.

Examine the photograph and answer following questions.

A. What is the sign in the picture?

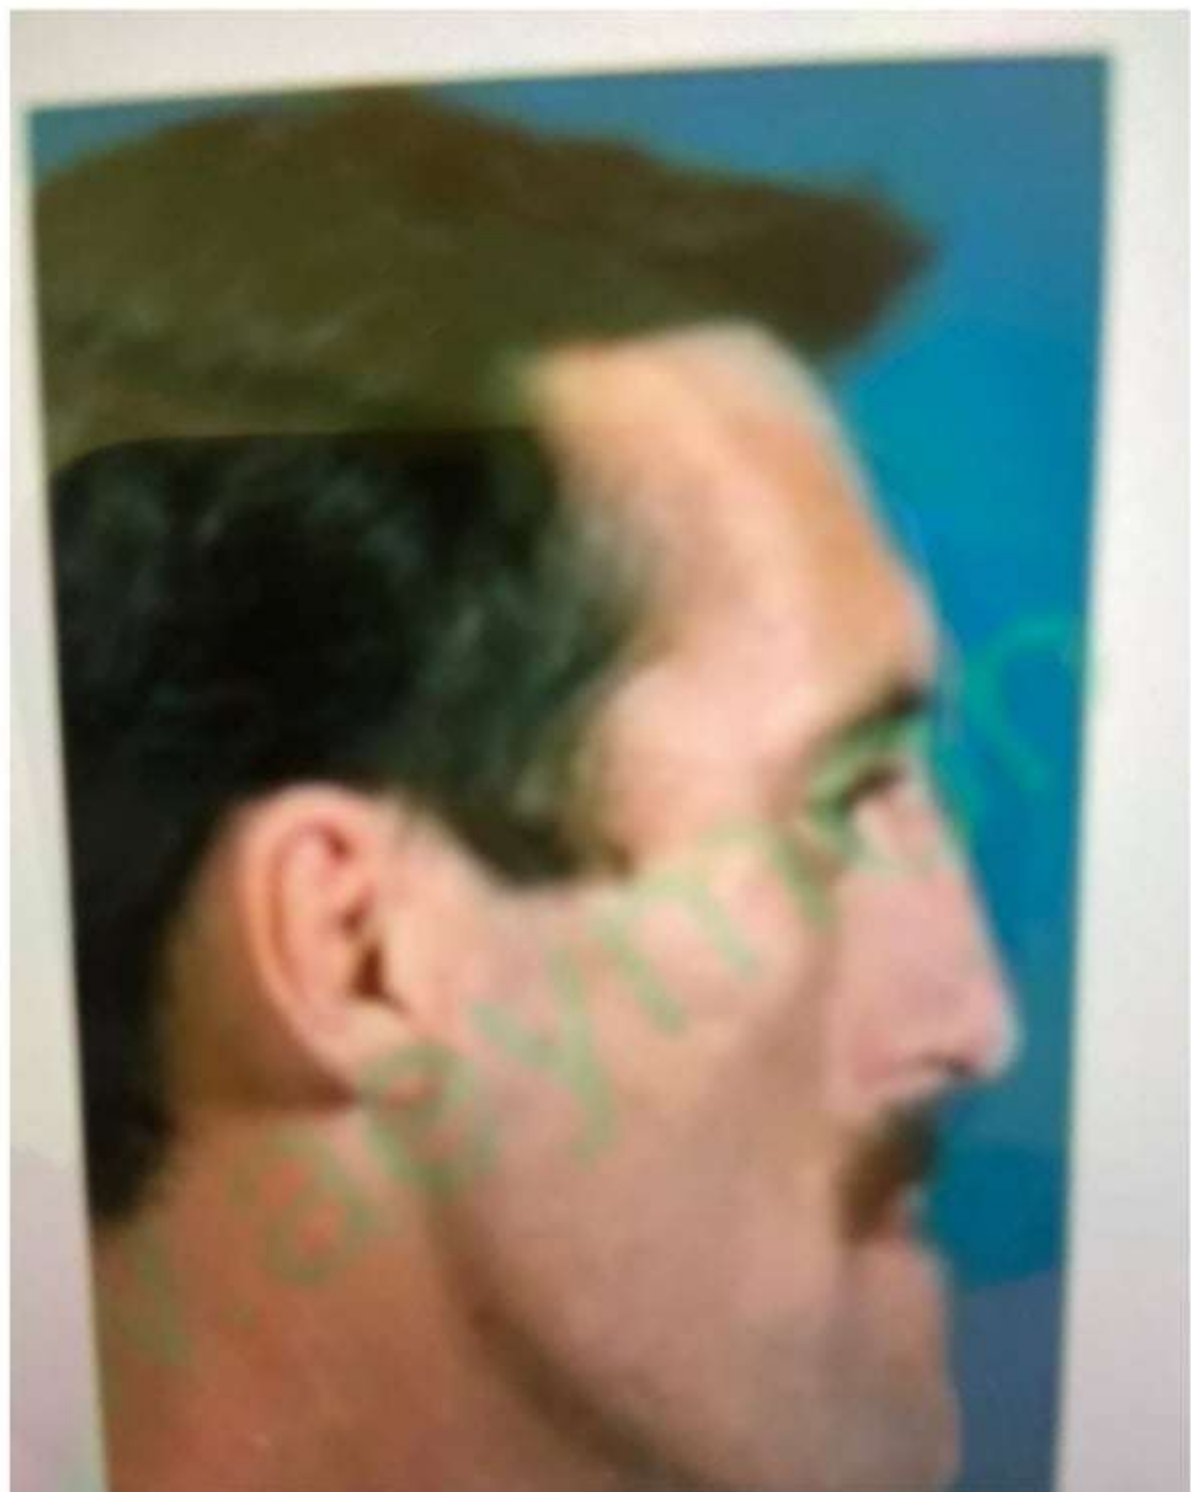

B. Four possible causes of this condition?

C. 3 special investigation to find out underlying cause?

Answer:

- clubbing
 - Bronchiectasis, Lung Cancer, Cystic fibrosis, pulmonary fibrosis
 - X ray chest, HRCT, Bronchoscopy, Sputum examination.
5. This 40 years old gentlemen is complaining frequent headache and sticking of food in his mouth while chewing.
- A. What is your diagnosis?
- B. What physical signs are visible in this picture?
- C. Name four important investigation for its diagnosis?
-

Answer:

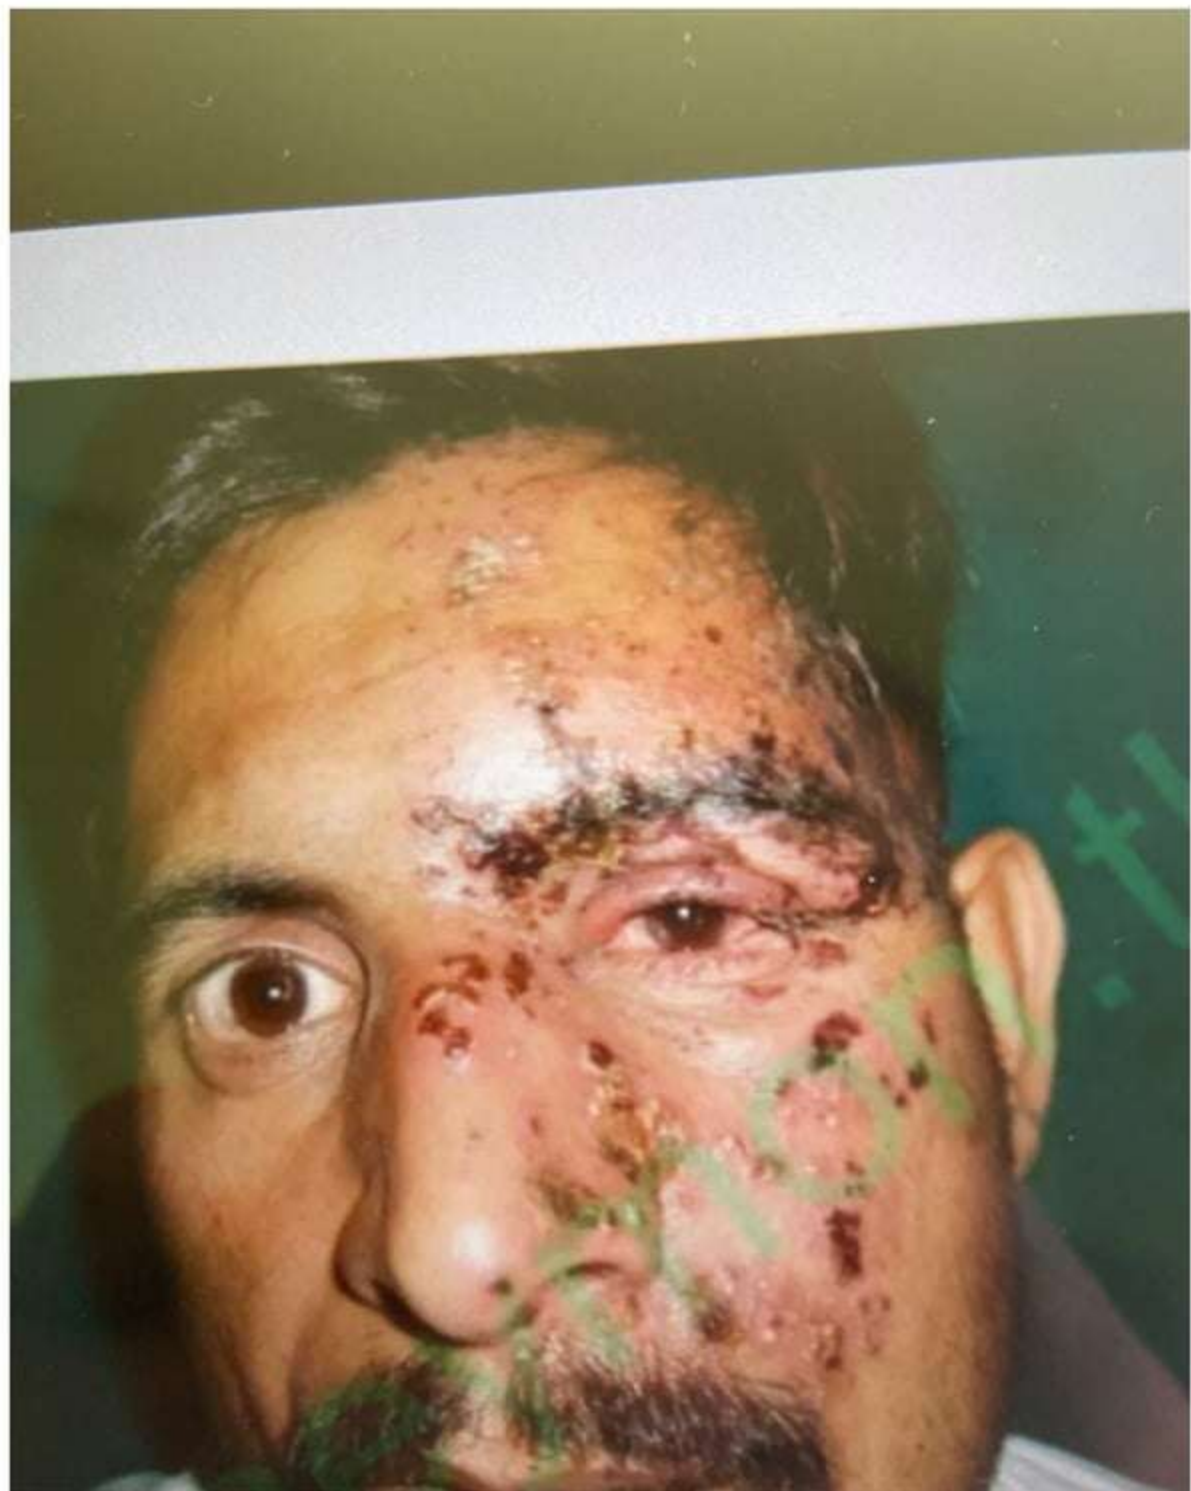

- Acromegaly
- Prognathism, Frontal bossing
- Xray Skull Lateral view, CT/MRI brain, GH level, GTT

6. A) What is your diagnosis?

B) What is the nerve supplying the area and mention its

Branches?

C) Name the etiological agent causing this disease and mention name of other disease which can be caused by this organism?

- herpes Zoster
- Trigeminal Nerve : Ophthalmic, Maxillary and Mandibular
- Chicken pox

7. A) What abnormality is seen in this X ray?
B) What disease this gentleman is likely to have?
C) Suggest three more useful diagnostic investigations?

- Lytic lesion in the skull
- Multiple Myeloma
- CBC, ESR, Serum protein Electrophoresis, Bone Marrow Aspiration

and Trepine.

8. A 34 years old lady presents with a none month history of weight gain, weakness and Amenorrhea. Examination reveals the appearance as shown, a BP of 180/110 and proximal myopathy. Urine R/E shows 2+ glucose and pregnancy test is Negative.

A) What sign is shown in this picture and What is diagnosis!

B) Name 3 Important diagnostic test?

Answer:

- Moon Face, Cushings Syndrome or Cushing disease

- 24 hours urinary free cortisol, Overnight dexamethasone suppression test, Low dose dexamethasone suppression test, High dose dexamethasone suppression test, ACTH

9. A 35 years old gentleman is complaining of severe headache and diplopia for the last one day?

A) write two positive findings in this picture?

B) What is the diagnosis?

C) What is the possible cause of this lesion?

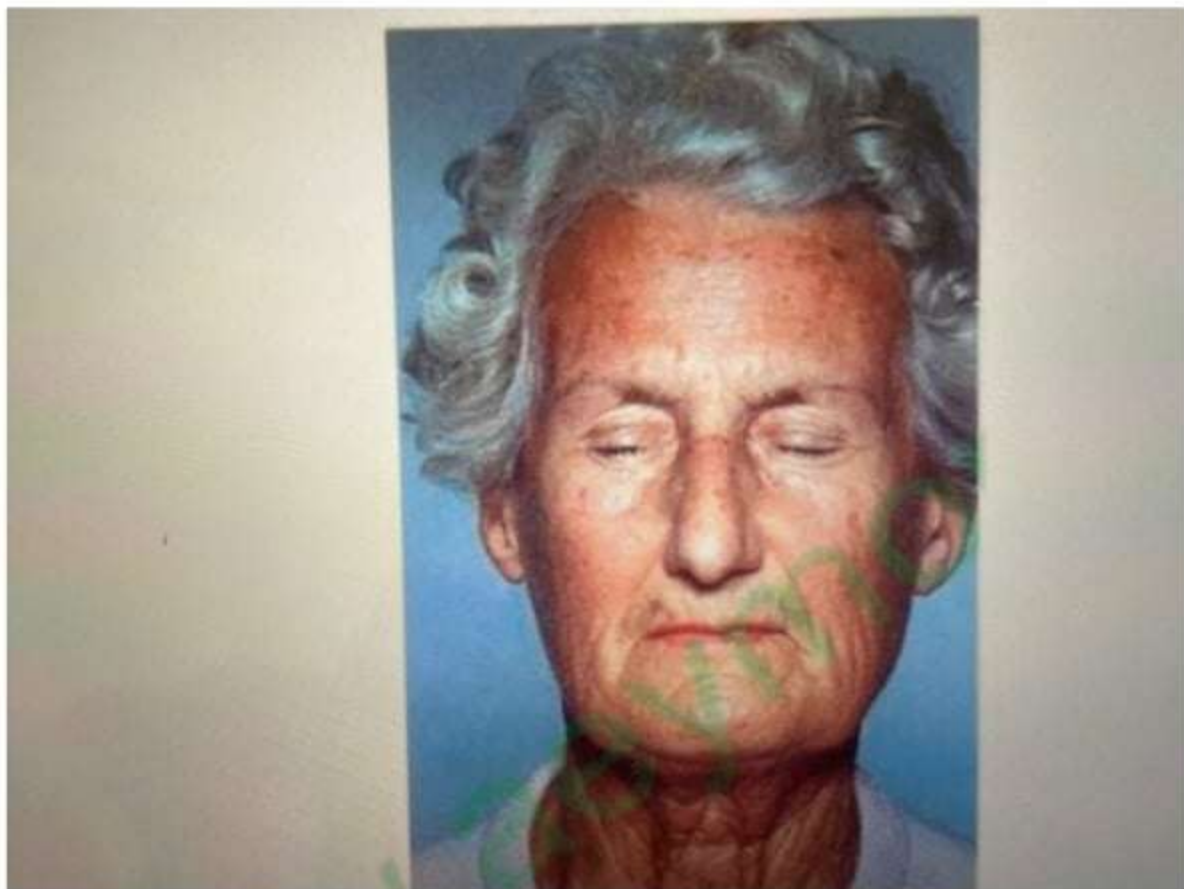

Answer

- dilated Pupils on right eye, Strabismus in right eye
- 3rd CN palsy
- Aneurysm of Right posterior communicating artery.

10. This patient presented to hospital with history of dysphasia and had aspiration pneumonia. She also gives history of bluish discoloration of hands off and on?

- A) What is the diagnosis?
- B) Name four systemic Complication of this disease?
- C) Name two diagnostic Investigations?

Answer:

- Scleroderma
- Four complication: Pulmonary Hypertension, GI Complication, Renal and Cardiac Complication
- ANF, Anti SCL-70, Anti centromere Antibody

11. 40 year old female has had pain and stiffness of several joints in the body for decade.

- A) what is the diagnosis?
- B) list Two drug for this condition?
- C) One Physical Abnormality seen in this picture?

Answer:

- RA
 - METHOTREXATE, Leflunomide, Quinine, Sulfasalazine
 - Ulnar Deviation
12. A 35 years Old female presents with weight loss and Tremors. On examination she is looking extremely agitated and has fine tremors of the finger?

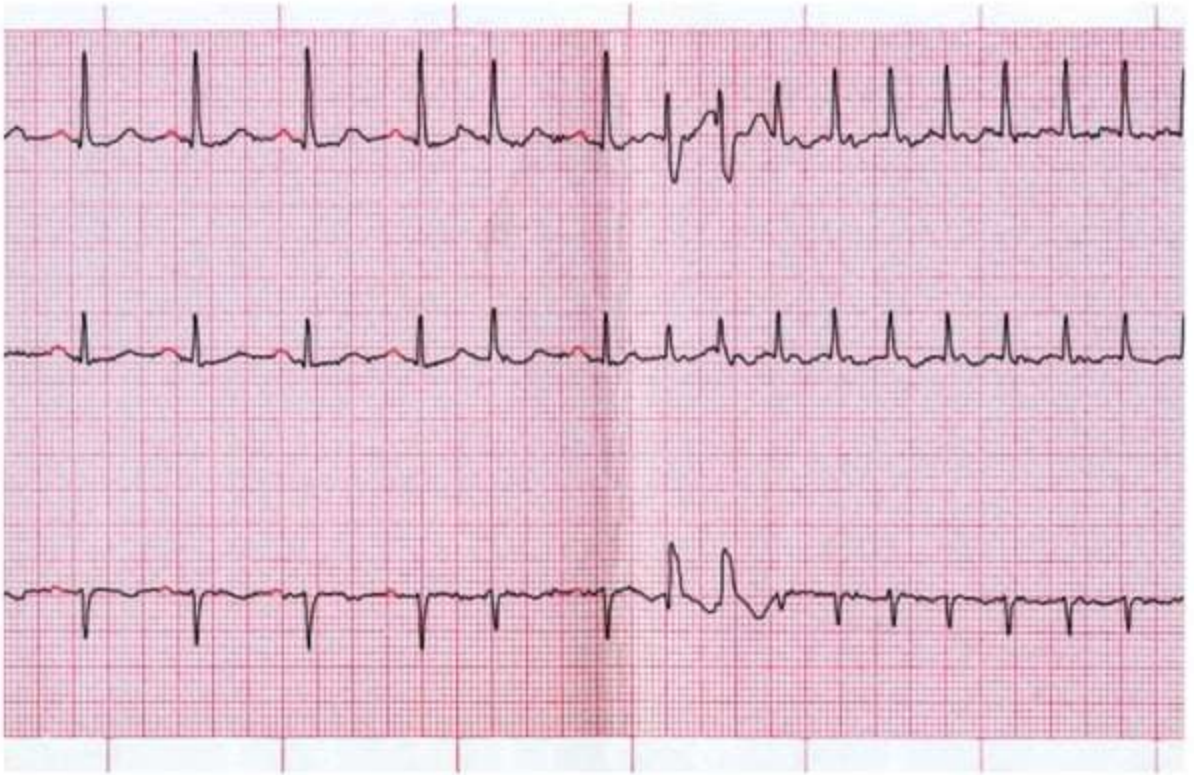

- A) What is most likely diagnosis?
B) Name three physical Signs in this patient?
C) List two investigation?

Answer:

- Hyperthyroidism due to Graves disease
- Tachycardia, Diffuse enlargement of Thyroid gland, bruit over thyroid, Pretibial Myxedema
- TFT, Thyroid USG, Iodine uptake test.

13. Examine the following ECG and answer following question?

- A) What is rhythm called?
B) What may be TWO abnormalities in examination of radial pulse
C) Enumerate 4 cause

Answer:

- A) Atrial Fibrillation
B) irregularly irregular, pulse deficit
C) Cause: @RITA
- RHD
 - Ischemic heart disease
 - Thyrotoxicosis
 - Alcoholic cardiomyopathy

14. The gentleman sitting in-front of you has been recently diagnosed to have positive anti HCV. Please Counsel him regarding
- A) prognosis of his condition
 - B) Diet
 - C) Advice to family as a whole

Answers

- A) Slowly progressive disease, no need to panic, prognosis is generally good except in advanced disease
- B) Candidates must emphasize that no dietary restrictions are required
- C) Strict Isolation not required

15. Identify following Needle

Fig: Bone marrow Biopsy needle.

- Can be done in prone and lateral position from iliac bone

Indication

- Leukemia
- Hodgkin and non hodgkin Lymphoma
- To see the response to Rx
- MM

- Can be done to diagnose infiltrative, granulomatous and leukemia.

Complication:

- infection
- Bleeding

16. 30 years old patient has presented with history of fever, headache and vomiting for three days. He has a history of chronic sinusitis.
- A) What Investigation is shown and what is the diagnosis?
 - B) Name three useful drug for this condition?
 - C) what is the definite treatment for this condition?

Answer:

A) Name of Investigation: Contrast enhanced CT, Diagnosis: Brain abscess

B) I/V Antibiotics which should cover gram positive, gram negative and Anaerobic organism for 6-8 weeks, Anti-epileptics, Mannitol

C) Surgical evacuation also treat Sinusitis

17. This is a pleural fluid analysis report of 20 years old male who presented with history of high grade fever and pain in left side of chest for one week.

- Color: turbid

- Protein: 5.1gm/dl
- TLC: 100,000/mm³
- PMN: 95%
- Lymphocytes: 5%
- Glucose: 3 mmol/dl
- PH: 7.1

A) What is the likely Diagnosis?

B) What treatment options you will consider?

Answer:

A) Empyema Thoracic

B) I/V antibiotics for 4-6 week, Chest tube drainage if required.

C) Instillation of fibrinolytic agent: usually in child: 250K Streptokinase and 10 K urokinase.

D) Surgical: decortication

Extra note:

Usually chest tube drainage is necessary for 1 week. Condition of chest tube removal

- Pleural fluid become serous
 - The amount of fluid drained is <50 ml/day
-

Table 2. Indicators of a poor prognosis with a complicated parapneumonic effusion

Fluid is pus

Positive Gram-stain or culture

Pleural fluid pH < 7.20

Pleural fluid glucose < 60 mg/dl

Pleural fluid LDH > 3X upper limit of normal for serum

Loculated pleural fluid

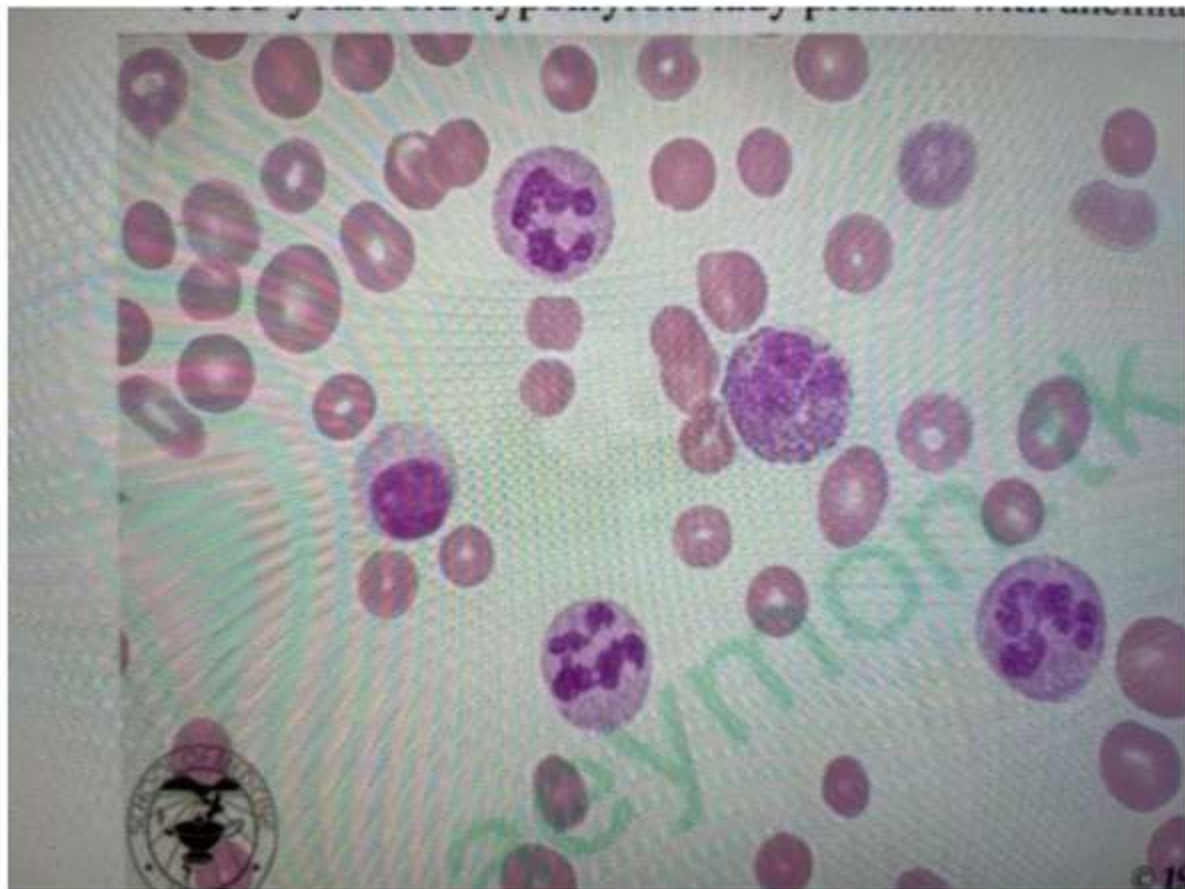

18. 30 years old male presents with high grade fever with chills and rigor for 3 days. He has received antimalarials and paracetamol from a GP.
- Hb: 6gm/dl
 - MCV: 110
 - TLC: 6900
 - Platelets: 180,000
 - Bilirubin: 5.4 mg/dl
 - AST/ALP: 30/90
 - PBS: No MP seen, Bite cells and Blister cells Seen

- A) what is most likely diagnosis?
- B) four agents which can precipitate an attack of this illness?
- C) Write two treatment steps?

Answer:

- A) G6PD Deficiency
- B) Nitrofurantoin, Chloroquine, Aspirin, sulfonamide
- C) Blood transfusions and avoid offending drug

19. 55 years old hypothyroid lady presents with anemia.

A) What is abnormality seen in the slide?

B) What are other 3 hematological Features of this disease?

Answer:

A) There is presence of hyper-segmented neutrophils along with macrocytes seen Megaloblastic anemia.

B) Hb: decreases

MCV: Increase

Reticulocyte count: Decrease

Platelets: Decreases

Bone marrow: Hyper-cellular with maturation arrest and showing megaloblastic changes in erythroid series, giant metamyelocytes, Dysplastic megakaryocytes and Increase iron stores

Fig: Pes Cavus Sign

Seen in

- Charcot Marie Tooth Disease
- Friedreich Ataxia
- CTEV

21. Patients present with Ataxia with following findings

Fig: Telangiectasia

Seen in Ataxia Telangiectasia

22. Spot the diagnosis

Fig: Inverted Champagne Bottle Appearance

Seen in Charcot Marie tooth Disease

23. Spot The Diagnosis

Fig: Port wine stain in one half of face
Seen in Sturge-Weber Syndrome

24.

Fig: Trousseau Sign

Trousseau's sign is the induction of carpal spasm by inflation of a sphygmomanometer above systolic blood pressure for three minutes

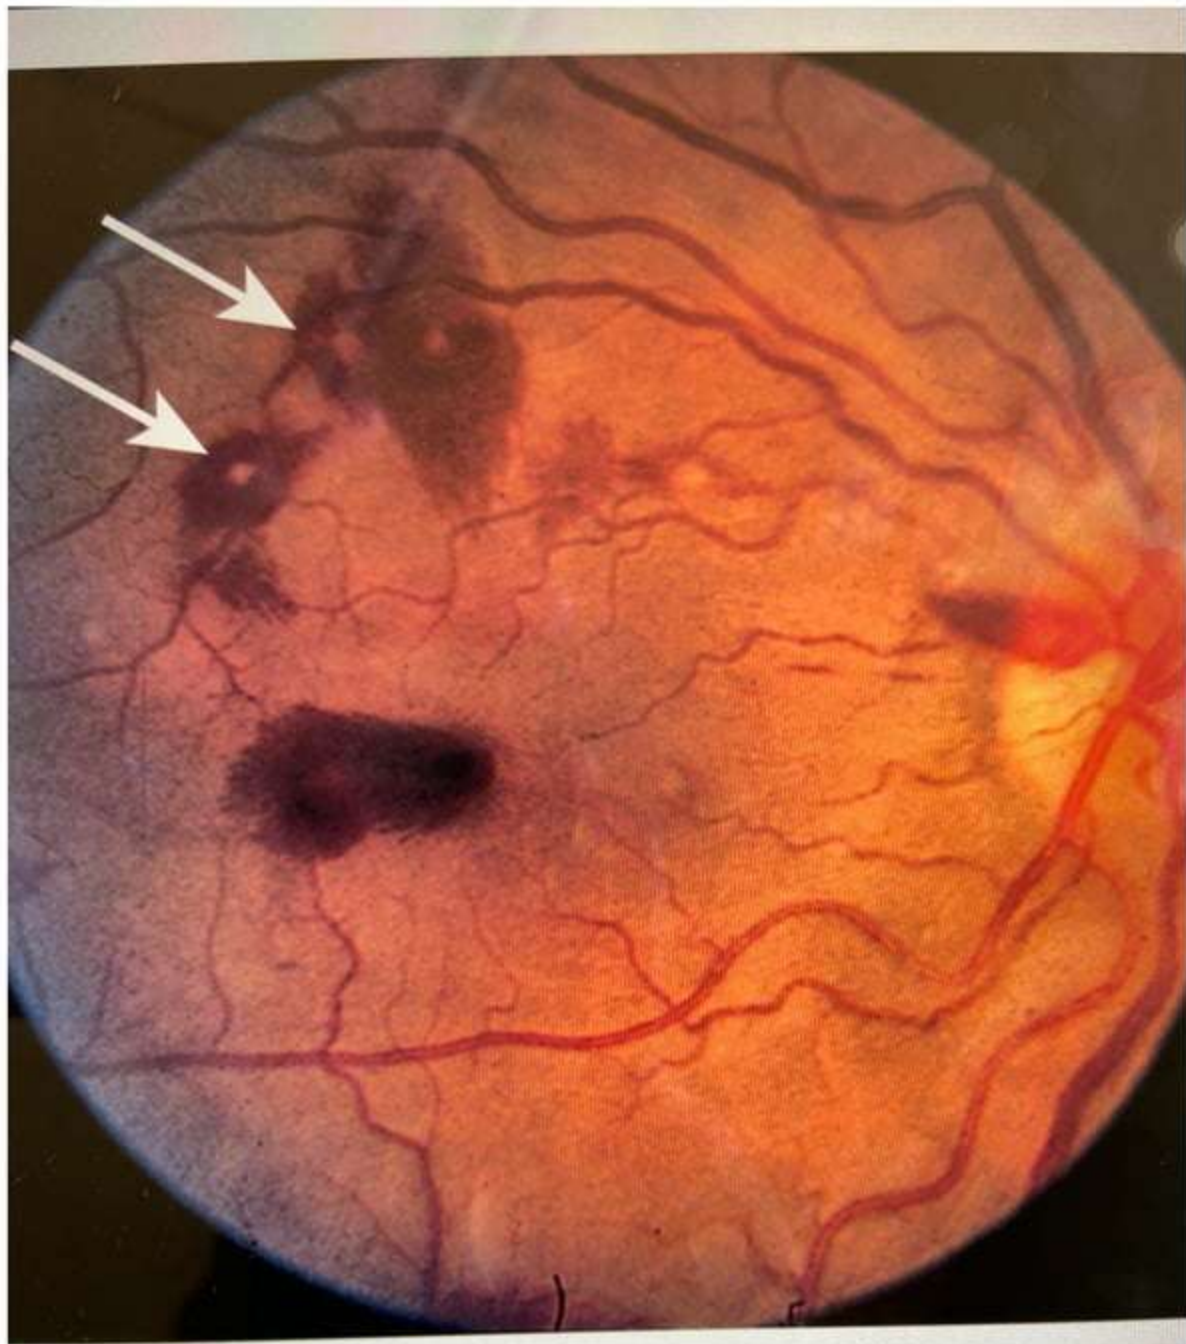

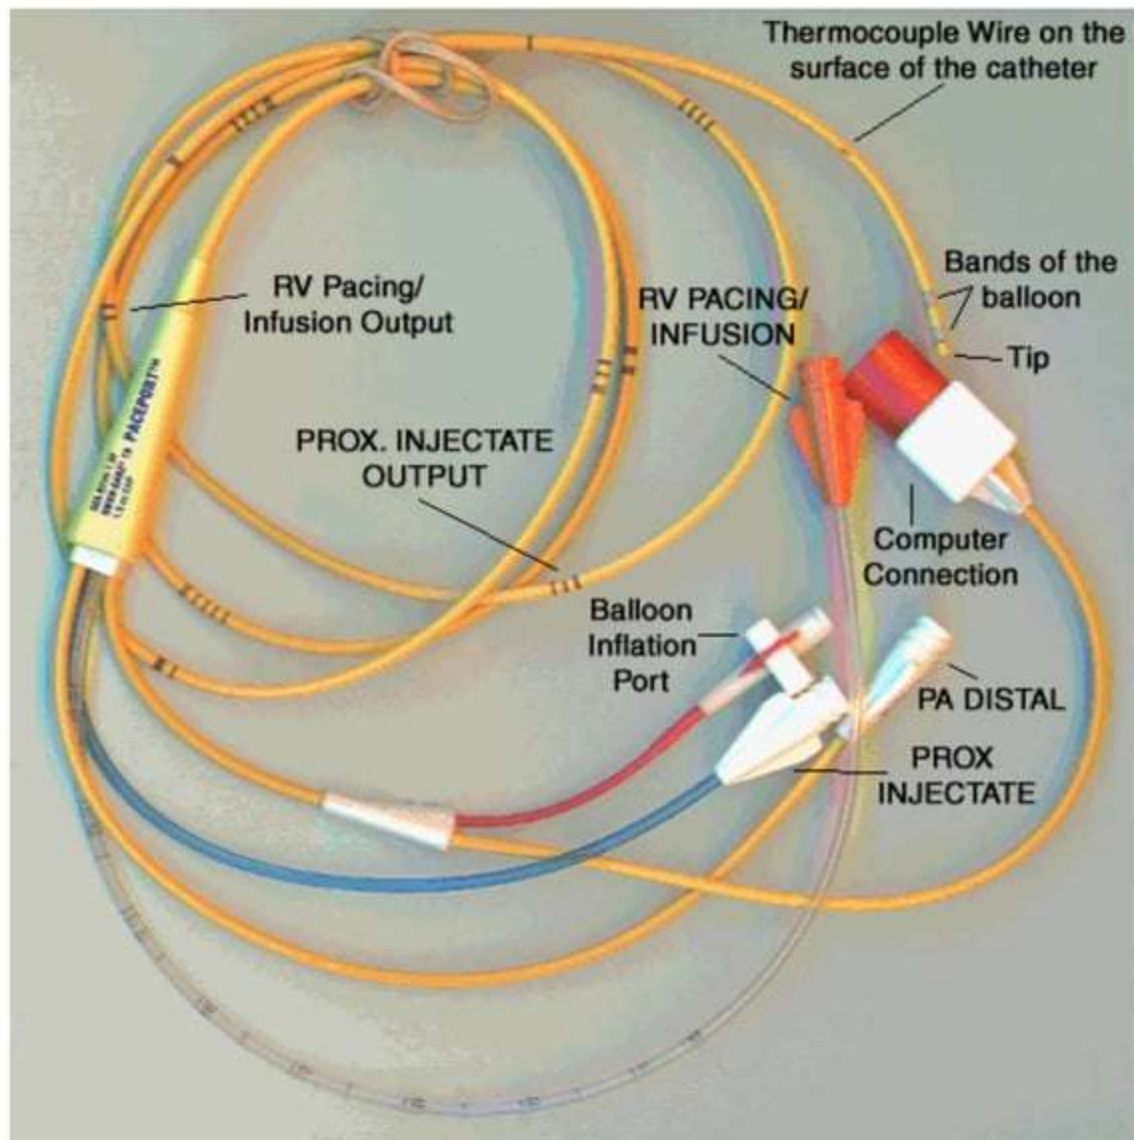

Fig: Area of hemorrhages with white dot in the center : ROTH SPOT, Seen in IE, Lymphoma, LeukeMia, Anemia, PAN, SLE

Empirical Antibiotics for IE:

Ampicillin plus Gentamycin $\pm$ methicillin/Vancomycin

01

X ray

55 year old male with history of hypertension presents with shortness of breath for 6 hours.

Here is his chest X Ray

1. What are the findings?
2. What is the diagnosis?

01 Key

Findings: Cardiomegaly, Upper lobe diversion

A 35 year old male presents with progressive shortness of breath for last 6 month. He also has dry cough and joint pains.

What are the findings in this chest X Ray?

What is the diagnosis?

List two differentials.

02 - Key

Findings:

Bilateral Hilar Lymphadenopathy

Right Paratracheal Strip enlargement

Bilateral infiltrates involving
predominantly the mid zones

Diagnosis: Sarcoidosis

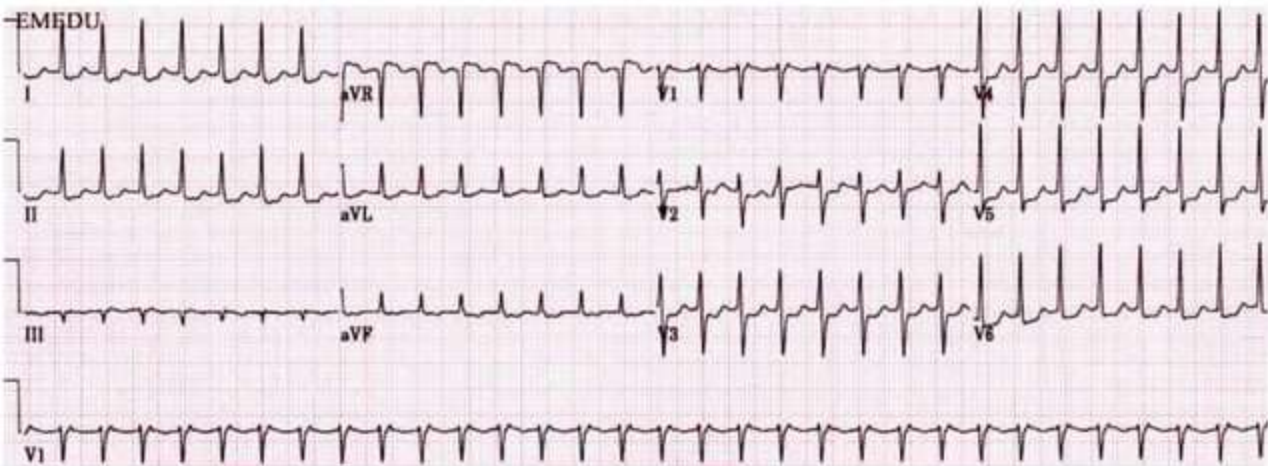

DD, TB, Lymphoma

03 - ECG

A 35 year old female presents with sudden onset palpitations. Here is her ECG.

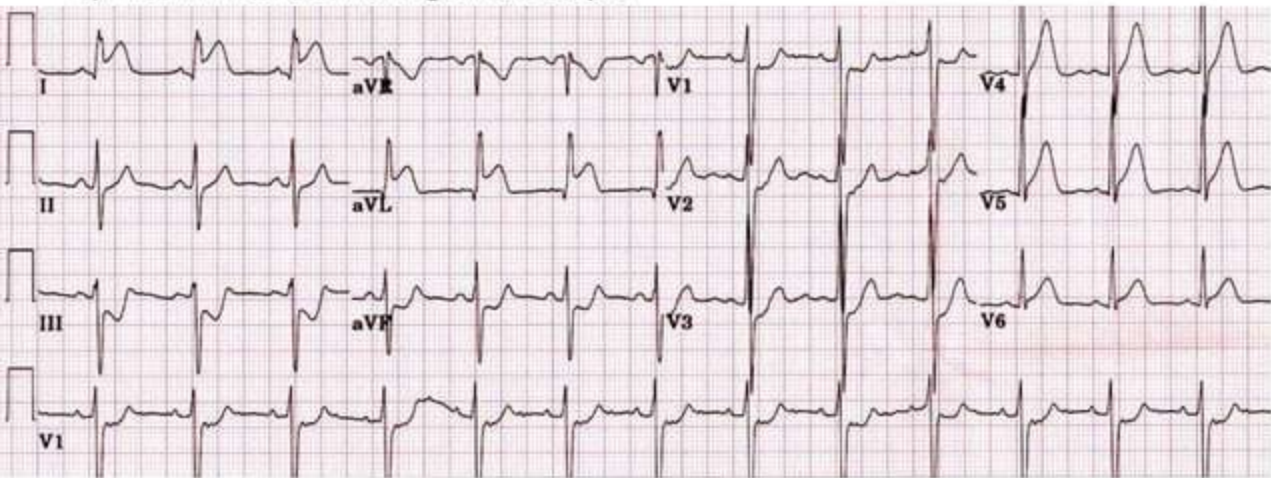

- What are the findings?
- What is the diagnosis?
- If her BP is 80/ 60 mmHg, what immediate step will you take?

04 - ECG

A 55 year old male presents with sudden onset chest pain and vomiting for two hours. Here is her ECG.

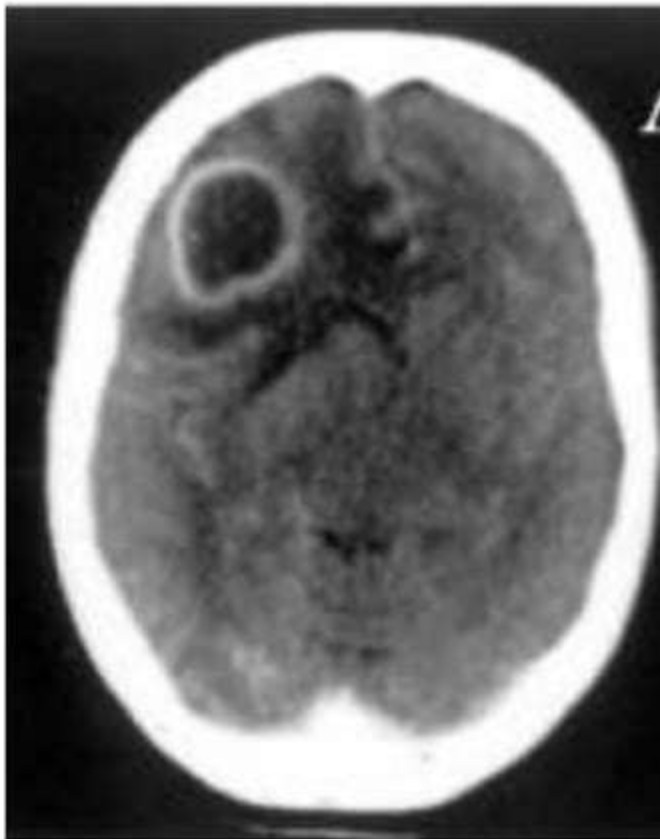

- What are the findings?
- What is the diagnosis?
- List immediate management steps.

05 - CT

A 30 year old male, IV drug abuser presents with fever, focal fits and altered mentation. On examination, there is left sided weakness.

- a) List four possible differential diagnoses.

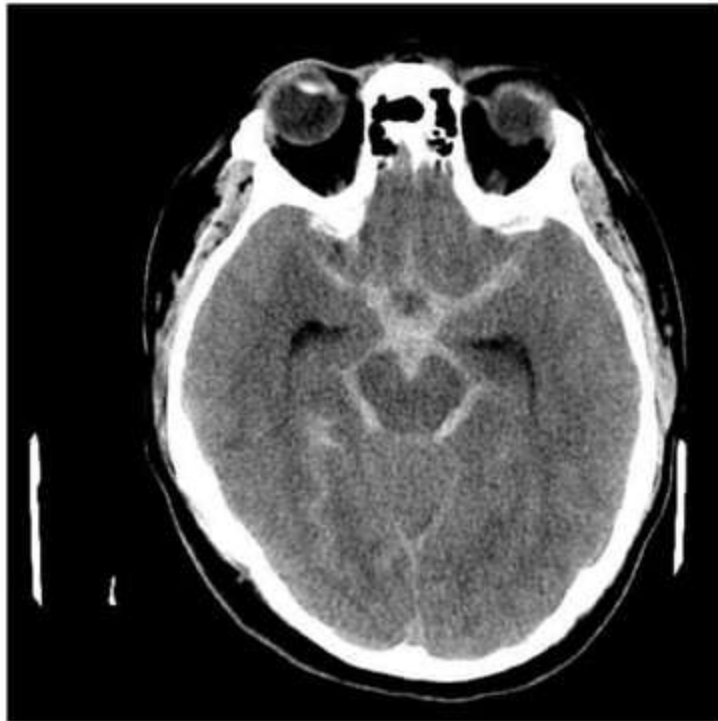

06 - CT

A 55 year old hypertensive male presents with sudden onset of headache and irritability.

What is the diagnosis?

How will you manage?

What is the diagnosis?

How will you manage?

- A 23 year old female has an impulsion to check the door locks again and again. She checks the locks 6 to 7 times before sleeping but still feels insecure and wants repeated reassurances.

What is the diagnosis?

How will you manage?

- A 50 year old female survivor of a bus bomb blast has difficulty sleeping 6 months after the incident. She has frequent flashbacks of the event and avoids public transportation. There are also frequent episodes of weeping.

Identify the skin lesion.
What is the treatment?

Identify the skin lesion.
How will you treat?

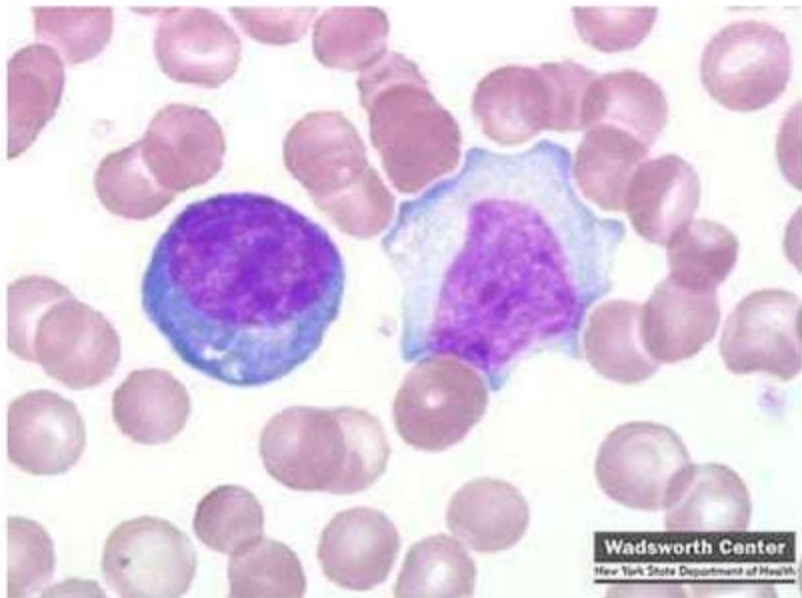

- a) What is the lesion?
- b) What lab investigation will you suggest?

An 18 year old girl presents with fever, sore throat and cervical lymphadenopathy.

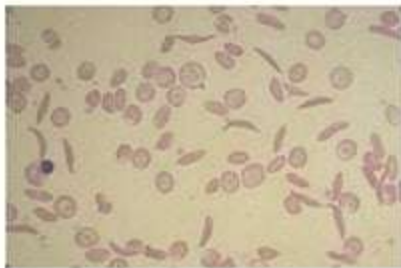

- a) Identify the peripheral film.
- b) What further investigation will you suggest?

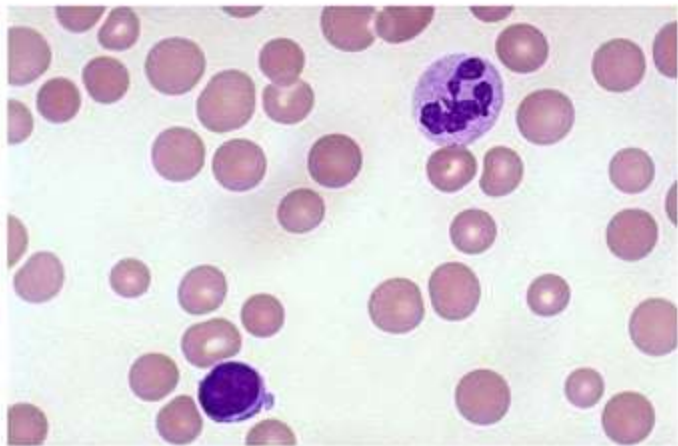

Wadsworth Center

New York State Department of Health

Identify the peripheral film
What is the diagnosis?

Identify the peripheral film.
What further investigations will you order?

Interpret the given CSF report.

- CSF RE Report
 - Appearance: Turbid
 - Xanthochromia: Nil
 - TLC: 250
 - N 95 %
 - L 05 %
 - Proteins 78mg/dl
 - Sugar 27mg/dl (BSR 120 mg/dl)

Interpret the given Arterial Blood
Gases Report.

- ABGs
 - pH 7.31
 - pCO₂ 65 mmHg
 - pO₂ 47 mmHg
 - HCO₃ 30 mEq/L
 - O₂ Sat 76%

What is the diagnosis?

What further investigations will you order?

How will you manage?

- A 31 year old female presents with history of fever and jaundice for 7 days, and altered consciousness for 1 day.
- On exam, she has bruises all over her body.
- Labs reveal
 - Bilirubin 14 mg/dl
 - ALT 3327 IU/ml
 - AST 2980 IU/ml
 - Alk Phos 380 IU/ml
 - PT 50/13 sec
 - aPTT 78/33 sec

What is your diagnosis?

List one important differential.

How will you investigate?

- A 35 year old female presents with worsening fatigue over the past 6 months. On examination she has bilateral partial ptosis. Power 4/5 in all 4 limbs.

- **Station 3**

- (3) Instrument
- (a) Identify the instrument.
- (B) Contraindications for its use.
- (c) specific precautions during the procedure.

Station 6

Identify the rhythm
Treatment?

Station 9

- A 14 year school girl presents in emergency with 03 days severe abdominal pain and vomiting. On examination she is drowsy, severely dehydrated and has labored breathing. She has a BP of 90/60mm Hg and her temp is 100°F. Her blood sugar is 600mg/dl.
-
- What is the diagnosis?
- How will you investigate?
- How will you manage?

Station 10

- Identify this drug.
- State the indications and contraindications of its use.
- State the adverse effects.

Station 11

- A 21 year old woman gave birth to a child 2 days ago. After birth she is unable to sleep and reluctant to hold her child or feed him. But she claims of not harming her child.
- Diagnosis
- If treatment required? If yes then describe.
- Name the other pregnancy related psychiatric disorder.

Station 13

A 60-year-old male presented at the Emergency Room with severe chest pain of sudden onset. This was his CXR (Fig. 12.1). What is the diagnosis?

- (Interactive)
- A 23 year old male, known asthmatic for 4 years presents with worsening shortness of breath for 6 hours. On exam, he has Pulse of 140/min, RR of 40/min, and BP 90/60mmHg. He is cyanosed. Chest is bilateral silent.
- How will you manage this patient?

- (Interactive)
- A 28 year old female has recently been diagnosed with HIV while screening at the time of delivery of her first baby. She is worried and apprehensive about the disease.
- How will you counsel her?

- Key of HIV
 - Validity of Diagnosis, ELISA, Western blot?
 - History (Needlestick, Blood transfusion, sexual activity)
 - Reassurance
 - Counsel about HAART
 - Counselling regarding the risk of vertical transmission and breast feeding.

- BLS – Dummy
- A 50 year old male suddenly collapses in the market. You happen to be at the site. How will you proceed?

What are the indications of this drug?
List 3 side effects

Clubbing

Lid Lag
